# 1" (Ø 56 mm) Technical Information Tank Unit (Adapter) and Hose Unit (Coupler)

Material	Maximum Working Pressure	Test Pressure	Minimum Burst Pressure
Aluminium	16 bar / 232 psi	24 bar / 348 psi	80 bar / 1160 psi
Brass/Gunmetal	16 bar / 232 psi	24 bar / 348 psi	80 bar / 1160 psi
Stainless Steel	25 bar / 363 psi	37,5 bar / 544 psi	125 bar / 1813 psi
Titan	25 bar / 363 psi	37,5 bar / 544 psi	125 bar / 1813 psi
Hastelloy	25 bar / 363 psi	37,5 bar / 544 psi	125 bar / 1813 psi
PEEK	6 bar / 87 psi	9 bar / 131 psi	30 bar / 435 psi

#### Connections

 $3\!4$  ", 1" and 11/4" in BSP, NPT or metrical thread, or flanged inlet.

#### Applications

For industrial process plant, road and rail tankers, IBC containers, pharmaceutical and petrochemical industries, diesel locomotive refuelling etc. Recommended for all types of mini bulk liquid product transfer, including container and drum filling, or on any application where spillage needs to be minimized.

#### Media

Petroleum products: gasoline, diesel, oil etc. Chemical products: e.g. ethylene oxide, propylene oxide, acrylonitrile, butadiene, ammonia, vinyl chloride, toluene, xylene, sulphuric acid, phenol etc. Gas: vapor recovery/balance systems for various media.

#### Material of Body

Aluminium, brass, stainless steel, Hastelloy and PEEK. Others on request.

#### Seals

Standard seals in FPM (Viton<sup>®</sup>) - alternatively EPDM, FKM (Chemraz<sup>®</sup>, Kalrez<sup>®</sup>), NBR/HBNR. Other materials on request.

High Flow Rates / Low Pressure Drop Allows maximum product transfer with minimal losses

Recommended Maximum Flow Rates 200 litres / minute (fuel)

#### Selectivity

avoid mixing products

To avoid product contamination caused by connecting a hose unit to the wrong tank unit, selective versions of the hose and tank units are available. Each unit has a number of selective positions, designated by a coded part number according to the coupling size – specify when placing order. See page 32 ff.

#### Interchangeability

Compatible with couplings of other manufacturers.

#### Connections

2<sup>1</sup>/<sub>2</sub>" and 3" in BSP, NPT and flanged inlet.

#### Applications

For road and rail tanker bottom loading/unloading, tanks and containers, or on any application where product contamination and spillage needs to be minimized.

#### Media

Petroleum products: gasoline, diesel, oil etc. Chemical products: ethylene oxide, propylene oxide, acrylonitrile, butadiene, ammonia, vinyl chloride, toluene, xylene, sulphuric acid, phenol etc. Gas: vapor recovery/balance systems forfor various media.

Dry powder

#### Material of Body

Aluminium, brass/gunmetal, stainless steel, Hastelloy and PEEK. Other materials on request.

#### Seals

Standard seals in FPM (Viton<sup>°</sup>), EPDM, Chemraz<sup>°</sup>, Kalrez<sup>°</sup>, NBR. Other materials on request.

High Flow Rates / Low Pressure Drop Allows maximum product transfer with minimal losses.

Recommended Maximum Flow Rates 1500 litres/minute (fuel)

#### Selectivity

- avoid mixing products

To avoid product contamination caused by connecting a hose unit to the wrong tank unit, selective versions of the hose and tank units are available.

Each unit has a number of selective positions, designated by a coded part number according to the coupling size – specify when placing order. See page 32 ff.

#### Interchangeability

Compatible with couplings of other manufacturers.

# 3" (Ø 119 mm) Technical Information Tank Unit (Adapter) and Hose Unit (Coupler)

# According to NATO STANAG 3756

Material	Maximum Working Pressure	Test Pressure	Minimum Burst Pressure	
Aluminium	10 bar / 145 psi	15 bar / 218 psi	50 bar / 726 psi	
Brass/Gunmetal	Gunmetal 16 bar / 232 psi		80 bar / 1160 psi	
Stainless Steel	inless Steel 25 bar / 363 psi		125 bar / 1813 psi	
Titan	25 bar / 363 psi	37,5 bar / 544 psi	125 bar / 1813 psi	
Hastelloy	lastelloy 25 bar / 363 psi		125 bar / 1813 psi	
PEEK 6 bar / 87 psi		9 bar / 131 psi	30 bar / 435 psi	

#### Connections

3" in BSP, NPT and flanged inlet.

#### Applications

For road, rail tanker loading/unloading, filling of tanks and containers, refuelling and loading/unloading bunker boats (marine tankers) and small ships. Also suitable for other applications where high loading rates are required and product contamination and spillage needs to be minimized.

#### Media

Petroleum products: gasoline, diesel, oil etc. Chemical products: ethylene oxide, propylene oxide, acrylonitrile, butadiene, ammonia, vinyl chloride, toluene, xylene, sulphuric acid, phenol etc.

Gas: vapor recovery/balance systems Dry powder.

#### Material of Body

Aluminium, brass/gunmetal, stainless steel, Hastelloy and PEEK. Other materials on request.

#### Seals

Standard seals FPM (Viton<sup>°</sup>), EPDM, FFKM (Chemraz<sup>°</sup>, Kalrez<sup>°</sup>), NBR. Other on request.

High Flow Rates / Low Pressure Drop Allows maximum product transfer with minimal losses.

Recommended Maximum Flow Rates 2000 litres/minute (fuel)

#### Selectivity

- avoid mixing products

To avoid product contamination caused by connecting a hose unit to the wrong tank unit, selective versions of the hose and tank units are available. Each unit has a number of selective positions, designated by a coded part number according to the coupling size – specify when placing order.

#### Interchangeability

Compatible with couplings of other manufacturers.

# 4" (Ø 164 mm) Technical Information Tank Unit (Adapter) and Hose Unit (Coupler)

# According to NATO STANAG 3756

Material	Maximum Working Pressure	Test Pressure	Minimum Burst Pressure
Aluminium	16 bar / 232 psi	15 bar / 218 psi	50 bar /   726 psi
Brass/Gunmetal	16 bar / 232 psi	24 bar / 348 psi	80 bar / 1160 psi
Stainless Steel	25 bar / 363 psi	37,5 bar / 544 psi	125 bar / 1813 psi

#### Connections

4" in BSP, NPT and flanged inlet.

#### Applications

Recommended for HiFlo-loading / unloading of rail tankers, aviation refuellers and road tankers. Also suitable for ship to shore transfer, ship to ship transfer and ship to rig transfer or on any application where spillage needs to be minimized.

#### Media

Petroleum products: gasoline, diesel, oil etc. Chemical products: ethylene oxide, propylene oxide, acrylonitrile, butadiene, ammonia, vinyl chloride, toluene, xylene, sulphuric acid, phenol etc. Gas: vapor recovery/balance systems forfor various media. Dry powder

#### Material of Body

Aluminium, brass/gunmetal, stainless steel, Hastelloy and PEEK. Other materials on request.

#### Seals

StandardSeals FPM (Viton<sup>°</sup>), EPDM, FFKM (Chemraz<sup>°</sup>, Kalrez<sup>°</sup>), NBR. Other on request.

High Flow Rates / Low Pressure Drop Allows maximum product transfer with minimal losses

Recommended Maximum Flow Rates 3500 litres/minute (fuel)

#### Selectivity

- avoid mixing products

To avoid product contamination caused by connecting a hose unit to the wrong tank unit, selective versions of the hose and tank units are available.

Each unit has a number of selective positions, designated by a coded part number according to the coupling size – specify when placing order. See page 32 ff.

#### Interchangeability

Compatible with couplings of other manufacturers.

# Dust Cap for Tank Unit (Adapter)

To increase the lifespan of DDC tank units, dust caps should be used. They protect the couplings against the ingress of dirt and water.

Materials: polyethylene, aluminum, stainless steel or rubber. Supplied with cable attachment and eyelets (rubber design DN 40 - 50 with integrated eyelet).

With the exception of the simple rubber type, the caps feature a safeguard against inadvertent release: before removing the cap, a spring-loaded locking pin is pulled.

Polyethylene composite caps in sizes in sizes DN 40-80 mm include a patented design with lip seal to facilitate the handling.

PE-Composite Patent No. 000840780-0001

# Pressure Cap for Tank Unit (Adapter)

used as third closing device according to ADR/RID, par. 6.8.2.2.2

Mann Tek pressure caps have been developed to increase the safety of the operating personnel and improve leak protection.

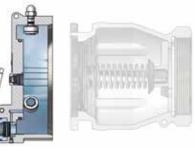

In case of an upstream leakage (male coupling untight) or extensive pressue buildup within the tank outlet due to expanding gas, the cap will indicate it. The operator relieves the pressure by pressing the lever and can then safely remove the cap.

#### Features

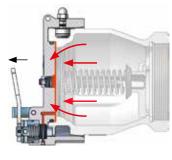

- Corresponds to ADR/RID regulations
- Third closing device' for road and rail tankers, containers
- Working pressure up to 25 bar
- Excess pressure indicator
- Safe relief for pressure
   and vacuum
- Customs /tamper sealing possible (holes for sealing wire)
- Automatic locking
- Anti-theft protection: locking with standard padlock possible

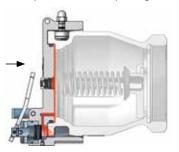

#### How It Works:

Pressure Indicator (warns for overpressure)

Press the handle for pressure relief, opening

Inch/DN	Material of Body1 <sup>1)</sup>	Seal <sup>2)</sup>	Working Pressure	Mann Tek Code No.
1½ - 2" Ø 70 mm, DN 40-50	SS		25 bar / 363 psi	R200A4401

# Dust plug for Hose Unit (Coupler)

To increase the lifespan of couplers, dust plugs should be used. They protect the couplings against the ingress of dirt and water. Materials: polyethylene, aluminum, stainless steel. Supplied with cable attachment and eyelets.

# Selectivity System: Overview

To prevent accidental mixing of media, a selectivity sytem for DDCouplings is available. Tank units are equipped with slots, hose units with pins.

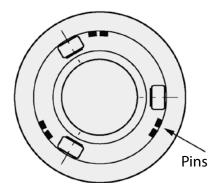

Depending on the size of the coupling and required compatibility, the number of possible 'selectivity positions' varies.

In case of questions please consult our sales team.

Tank Unit

Hose Unit

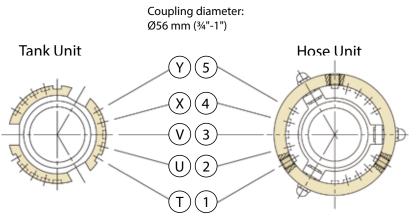

Product	Size	Position
Avgas 100 / 130	21⁄2", 3", 4"	1
Avgas 108 / 135	21⁄2", 3", 4"	2
Avgas 115 / 145	21⁄2", 3", 4"	3
Avtur (Derd 2495) JP1, ATK, ATF 650. JET 'A'	21⁄2", 3", 4"	4
Avtag (Derd 2486) JP4, ATG, JET 'B'	21⁄2", 3", 4"	5

#### Example: Aircraft Refuelling

The major oil companies have agreed to use the following selectivity positions for aviation refuelling. For the 21/2", 3" and 4" sizes.

## Selectivity DDCouplings

# Selectivity System for 1" (Ø 56 mm)

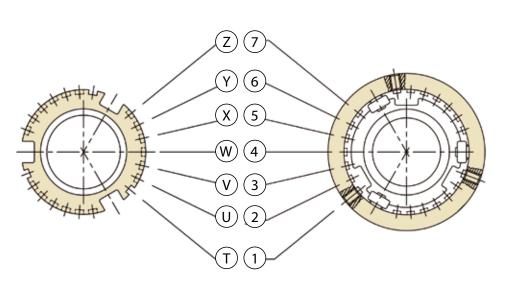

Selectivity system: Interchangable with other manufacturers.

Each unit can be provided with selectivity according to two systems – with 5 or 10 positions (see chart).

When ordering, please add "/SEL" and the chosen selectivity to the Mann Tek Code No. Examples: S103A4401/SEL 1 (T) or S103A4401/SEL 12 (TU)

## Selectivity System for 2" (Ø 70 mm)

Coupling diameter: Ø 70 mm (1½"-2")

Media	Position
acrylonitrile	4 (X)
ethylene oxide	2 (U)
Propylene eoxid	3 (V)

Selectivity positions for acrylonitrile, ethylene oxide and propylene oxide for 1"

#### With 5 Positions

Т	U	V	Х	Y

# **Couplings with Special Flanges**

On request we manufacture all combinations of flange thickness / holes and length

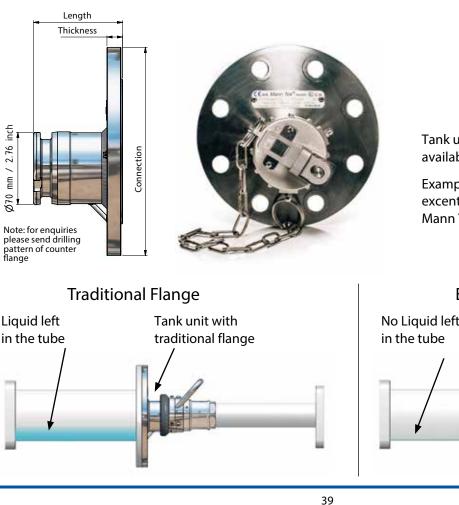

Example: 2" (Ø 70 mm) tank unit (adapter) with flange 4" ANSI 150 psi, Code No: T263A4401

ц

mm / 2.76

Ø70

# Tank Unit (Adapter) – Excentrical Flange

## Tank Unit with Short Piston

When coupled, the piston spindle does not protrude. This special type is useful e.g. for the direct connection to ball vallves.

Example Mann Tek Code No.: T230B1101E

## Tank Unit with Drain Connection

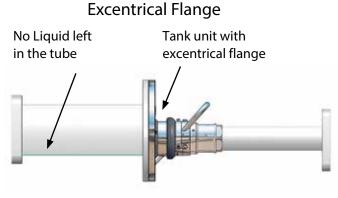

For easy venting and sampling.

Available for all tank units with flange.

Example Mann Tek Code No.: T298G1101 (f. TW1 Flansch)

Tank unit (adapter) with excentrical flange, available in sizes from 1" to 6".

Example 2" (Ø 70 mm) tank unit with excentrical flange 4" ASA 150, Mann Tek Code-Nr.: T263A4401Z

Tank Unit / Hose Unit with flange EN 1092-1 Type E (Spigot) / Type F (Recess)

Tank Unit Flange EN 1092-1 Type E (Spigot)

Hose Unit Flange EN 1092-1 Type F (Recess)

## With Victaulic<sup>®</sup> Connection

All DDCouplings can be manufactured with grooved pipe ends, compatible with the Victaulic system.

Suitable e.g. for military and offshore applications.

Example Mann Tek Code-Nr.

Victaulic<sup>®</sup> is a registred brand name of Victaulic Europe

## Hose Unit with Locking Device to Avoid Unwanted Disconnection

S2<u>144</u>A1101

Example: Addition to Mann Tek Code-Nr. ... L-S5

After the coupling the connection is automatically locked and can not loosen unintentionally. Pulling ring version LD-S2 or lever version L-S2, available for hose units (couplers) of any size.

Standard flange connections are usually executed with sealing surface Type A (Flat Face) oder Type B

Current alternatives are Type E (Spigot) and Type F (Recess), which are used from some road and rail

(Raised Face), see page 44.

tank manufacturers.

Example: Addition to Mann Tek Code-Nr. ... LD-S2

## Hose Unit with Ground Cable Assembly

Ground cables serve for the safe electrostatic dissipation of electrical currents (potential equalization).

They are prescribed for some applications, e.g. for aircraft refuelling.

Materials: Cable stainless with plastic coatingl, crocodile clamp brass, including assembly.

Mann Tek Code No. G-F3-12-XXX. When ordering please substitute XX with the required length (mm).

### Hose Unit with Integrated SBC Break Away

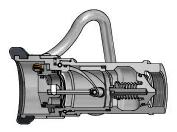

Where there is a risk of excessive force on the hose due to unexpected movement between the loading and unloading station.

For these application DDCouplings with integrated SBCouplings (Safety Break Away) are available.

Pleas add 'N' to the Mann Tek Code No., Example: SN211A4401.

### Hose Unit with Non-Return Valve

The medium can not flow back when the pump switches off while the coupling is still connected. Suitable for some wet hose applications.

Example Mann Tek Code-Nr.: S210<u>N</u>1101B

### Hose Unit f. Emergency Unloading

For the emergency unloading of rail or road tankers, the swivel of the coupler must be blocked for a fast connection with standard thread connections without tools.

Several different versions are available from Mann Tek.

#### prolongued coupling area

Hose Unit for Old Emco Version

# Extended Handles

For 2", 2<sup>1</sup>/<sub>2</sub>" and 3" Hose unit

2" (Ø 70 mm) coupler in 'big

mouth' special version, com-

patible with older Emco

Wheaton tank units

Example Mann Tek

### Hose Unit with Electronic Sensor

Electronic Sensor The sensor is detecting the position of the driving plate inside the hose unit.

No modifi cation on the tank unit is needed. That makes it possible to identify if the hose unit is connected to a tank unit and if they are in an open position.

Z : Option Sensor S2 : for 2" coupling S3 : for 2½" coupling S4 : for 3" coupling S5 : for 4" coupling S6 : for 6" coupling 44 : Housing material A1 : DC-PNP A2 : NAMUR Standard

44 : Housing material Stainless Steel

Example: additional Mann Tek Code No. ... <u>+ Z-S2-44-A1</u>

Available with ATEX on request

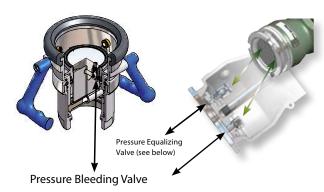

## Hose or Tank Unit with Pressure Bleeding Valve

Only for special operating conditions where there is the risk of excessive pressure increase through warming in the pipe / hose system.

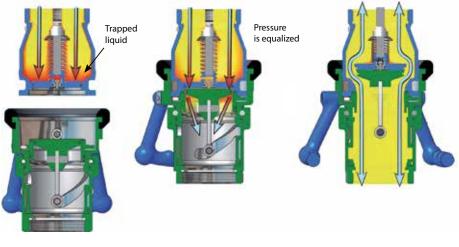

To protect the equipment, the optional pressure bleeding valve opens at a predetermined pressure limit.

Other applications: adapter pieces between different DDCouplings, hose assemblies with DDCouplings or DACouplings on both sides, e.g. military applications (logistic supply lines).

Example Mann Tek Code No. S210A1101B<u>U</u>

## Tank Units with Pressure Equalizing Valve

Trapped liquid in tank unit (above)

Pressure equalizing valve opens during the coupling

Open – pressure is equalized, full flow If liquid can get trapped in the tank unit during operation so that it can not escape, there is the risk that the tank unit is damaged during coupling.

Process engineering solution: open valves behind the tank unit to relieve the trapped liquid.

Technical solution:

the optional pressure equalizing valve relieves the pressure <u>during</u> <u>coupling</u> into the hose unit.

Example Mann Tek Code No. S210A1101B<u>P</u>

## Sight Glass with Integrated Strainer

for Petroleum Based Products

Tank an hose units in size 2½" BSP/NPT or 3" BSP/NPT are available with an additional sight glass with integrated strainer. During operation it is easy to see when the strainer shall be cleaned.

Three different screen sizes are available, 45 mesh (350 μm), 60 mesh (250 μm) or 100 mesh (150 μm).

Example for Code No. 'Sight Glass with Strainer: U1280S1101-XX – when ordering, replace XX with -45 for 45 mesh, -60 for 60 mesh, -10 for 100 mesh.

easy service of the strainer
 due to quick connection –

# **Colour Coding**

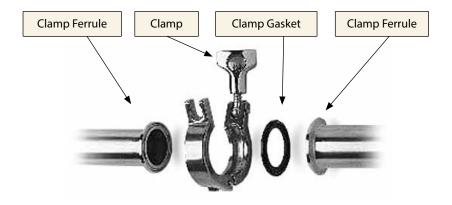

## **Couplings with Aseptic Flange**

DDCouplings are available with aseptic flanges to DIN 11864-2 or Triclamp flange connection.

Applications: for foodstuffs/beverages, fine chemicals, filter and water treatment plants.

Note: not suitable for pharmaceutical media with highest requirements to sterility.

On request for the mentioned coupling a test according GMP can be effected.

Tank and Hose Units with Aseptic Flange to DIN 11864-2 FDA conform seals

Tank and Hose Units with Triclamp Connection to DIN 32676 FDA conforme seals

## Tools for the Installation / Dismounting

DDCouplings can be installed and dismounted without special tools, with standard wrenches.

Additionally, below mentioned tools are helpful to open the piston (the valve plates) to empty the system:

Tool for draining tank units

Tool for draining hose units

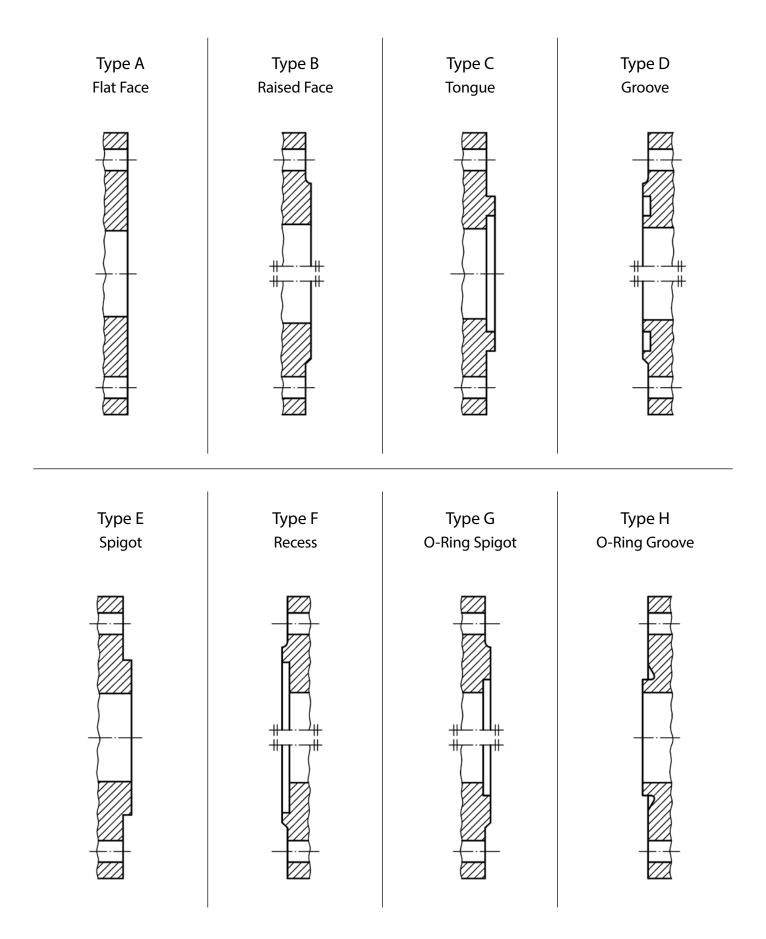

Wrench size to install or dismount tank and hose units:

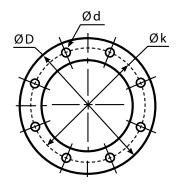

for Coupling	Wrench Size
1"	SW 50 mm
2"	SW 65 mm
21⁄2"	SW 85 mm
3"	SW 100 mm
4"	Tank Unit - 125 mm Hose Unit - 130 mm
6"	SW 190 mm

## **O-Ring Materials**

Designation	on Trade ISO 1629 ASTM Temp. Name ISO 1629 ASTM Range °C			Field of Application		
Nitrile Butadiene Rubber / Nitrile Rubber	Buna N° Europrene N° Hycar° Nipol N° Perbunan °	NBR	NBR	-55	110	Petroleum based products / aliphatic hydrocarbons (gasoline, diesel, oils, petroleum, propane, butane). Animal and vegetal oils and fats. Flame retardant liquids Silicone oils and greases. Water up to 80°C.
Ethylene-Propylene Diene Rubber	Dutral Keltan° Vistalon° Buna AP°	EPDM	EPDM	-55	120	Water, hot water, vapour, brake fluids, detergents. Alcohols, ketons, engine coolants, phosphate based flame retardants, organic and inorganic acids and alkalis. Not suitable for petroleum based products.
Fluoroelastomer	Fluorel <sup>®</sup> Technoflon <sup>®</sup> Viton <sup>®</sup>	FPM	FKM	-20	200	Petroleum based products / aliphatic hydrocarbons (gasoline, diesel, oils, petroleum, propane, butane) - also with high additive content. Phosphate based flame retardants. Silicone oils and greases, acids and alkalis.
Fluorosilicone Elastomer		MFQ	FVMQ	-60	200	Additional to the properties of silicone elastomers, fluorosili- cone elastomers show a consideably higher resistance to oils, fuels and solvents - especially to aromatic and aromatic and chlorinated hydrocarbons and alcohols.
Silicone	Silastic <sup>®</sup> Silopren®	MVQ	VMQ	-60	200	Very good heat and cold resistance, very good resistance to oxygene, ozone, UV rays and wheather influence. High electrical insulating properties, physiologically safe.
Hydrogenated Nitrile Butadiene Rubber	Therban° Tornac° Zetpol°	HNBR	HNBR	-35	120	Very good resistance to petroleum based products / aliphatic hydrocarbons like NBR, but better resistance to high temperature, ageing and wheather influence. Excellent physical properties also with high temperatures.
Butyl Rubber	Exxon Butyl <sup>®</sup> Polysar Butyl <sup>®</sup>	lir	IIR	-55	100	For O-Rings this material has largely been replaced by EPDM. Butyl is resistant to the same fluid types as EPDM and -except for resistance to gas permeation- it is somewhat inferior to EPDM for O-Ring use. Excellent weather resistance and gas permeation resistance. Not suitable for petroleum based products.
Perfluorinated Elastomer	CHEMRAZ <sup>®</sup> Kalrez <sup>®</sup> PERLAST <sup>®</sup>	FFPM	FFPM	-40	260	Best chemical resistance of all elastomers, including organic acids, acetic acid, benzoic acid, formic acid.
Chloroprene Rubber	Baypren <sup>*</sup> Neoprene <sup>*</sup>	CR	CR	-40	120	Resistant to refrigerants, ammonia, carbon dioxide, freon (R12, R13, R21, R22, R113 - R115), silicone oils, water, oxygen (low pressure), alkalis, coustic soda, alcohols, chlorine, ozone, castor oil and vegetable oils. Properties of CR are similar to NBR but slightly lower resistance to petroleum based producs, better resistance to ageing, UV light and ozone.
Polyester / Polyether Urethane Rubber	Polyurethane Adiprene° Urepan° Desmopan°	PU PUR AU EU	AU EU	-40	100	Very good resistance to petroleum based products, also with aromatic content. Good resistance to ozone and ageing. Very good mechanical properties. Not resistant to esters, concentrated acids and lyes, water above +50° C.
Polytetrafluoroethylene	Teflon°	PTFE	PTFE	-200	260	Universal chemical resistance except liquid alkaline metals and some fluorine compounds. Very good anti friction properties, low wear. High tempera- ture resistance. Physiologically safe. Use for statical seals only.
Fluorinated Ethylene Propylene	Teflon FEP°	FEP/MVQ	FEP/VMQ	-60	200	Universal chemical resistance except liquid alkaline metals and some fluorine compounds.
		FEP/FPM	FEP/FKM	-20	200	Very good anti friction properties, low wear. High tempera- ture resistance. Physiologically safe.
Perflouralkoxy	Teflon PFA°	PFA/MVQ	PFA/VMQ	-60	250	Universal chemical resistance except liquid alkaline metals and some fluorine compounds.
		PFA/FPM	PFA/FKM	-20	250	Very good anti friction properties, low wear. High tempera- ture resistance. Physiologically safe.
Tetrafluoroethylene- Propylene Copolymer Elastomer	Aflas°		TFE / P	-25	200	Petroleum based products, oils and greases, brake fluids, fuels, alcohols, heat transfer media, oils. amines, acids, al- kalis.

Note: Specifications in this chart are based on the information given by our suppliers together with published guides. This is not always a guarantee for a proper function. If in doubt, please ask our sales team, statiing medium and operating conditions.

### **Comparison NPT and BSP Threads**

#### NPT (Conical Thread)

Please observe the following basic rules:

1. Always use some type of sealant (tape or paste) and apply sealant to male thread only. If using a hydraulic sealant, allow sufficient curing time before system is pressurized.

2. When using tape sealant, wrap the threads in a clockwise motion, starting at the first thread (open end of the coupling) and following the thread direction.

3. When using paste sealant, apply to threads with a brush, using the brush to work the sealant into the threads. Apply enough sealant to fill in all the threads all the way around.

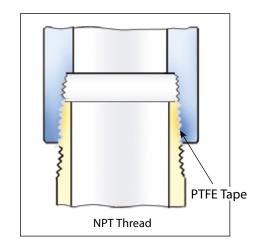

4. When connecting two pars of the same material that will require future disassembly, use a special sealant paste to avoid seizure (galling) of the thread.

5. When connecting parts made of different metals (e.g. steel and aluminium), standard tape or paste sealant is sufficient.

6. For sizes 2" and below, tape and paste perform satisfactory. When using thread tape, four wraps (covering all necessary threads) are usually sufficient.

7. For sizes 2½" and above, thread paste is recommended. If thread tape is used, eight wraps (covering all necessary threads) are usually sufficient. Apply more wraps if necessary.

8. For stubborn-to-seal threads, apply a normal coating of thread paste followed by a normal layer of thread tape.

9. For extremely stubborn to seal threads, apply a normal coating of thread paste followed by a single layer of gauze bandage followed by a normal layer of thread tape.

Note: When this procedure is done, the connection becomes permanent. Extreme measures will be necessary to disconnect these components. All other measures to seal the threads should be explored prior to use of this technique.

10. Over-tightening threads can be just as detrimental as insufficient tightening.

Couplings with conical (tapered) female and male threads normally have no flat sealing surface. The screwed-on thread jams before the end of the counter thread is covered. Therefore a sealing with a thread seal is not possible. The overall length of such a connection is always longer than the equivalent flat sealing system. A safe and promptly tight connection requires expert knowledge and clean work and is time-consuming. Subsequent tightening during operation is not possible. A new assembly requires the proper cleaning of the pitch from all squashed and hardenedremains of the sealing compounds.

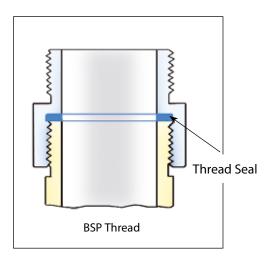

For these reasons, BSP parallel threads should be preferred.

#### BSP (Parallel Thread)

Easy sealing with flat thread seals:

Standard hose fittings are supplied with parallel threads and a flat sealing surface. This allows to use the full thread length for screwed-on parts. Due to the short length, a good transfer of force is guaranteed.

The thread seal is positioned within a recess of the female part and can not fall out. For a safe connection, the parts simply have to be screwed together – subsequent tightening during operation is possible at any time. A change of seals or reassembly do not require any expert knowledge. The European standardisations for hose assemblies require parallel threads with flat seals, because of these advantages.

### **Operating Advice for Mann Tek Couplings**

#### This advice is supplementary to your standard terminal operational procedures.

DACouplings, DDCouplings and DG-Couplings are specifically designed for the bulk transfer of liquids and vapours. The materials of construction, including the seals should already be confirmed as compatible prior to installation. If in doubt, check before operation. Our help documents "Installation advice for DA-Couplings, DDCouplings and DGCouplings" plus "Specification Advice" are designed to assist you.

All DACouplings, DDCouplings and DG-Couplings are marked with a maximum pressure rating that shall not to be exceeded. With careful use and regular maintenance they will give safe and trouble free operating for many years.

Service instructions are available for all DACouplings, DDCouplings and DGCouplings upon request. The life expectancy and maintenance frequency of the couplings is dependent upon many variables such as cycles/day, pressures, contaminates etc., but the most significant factor besides correct installation is the correct use. The following information is designed to assist in your care of the couplings and associated equipment.

#### Daily visual inspection

All hose units should be briefly inspected at the start of each day's operation. Look inside the connection socket. Check that the three rollers are not obviously damaged. Check that the connection socket area is free from dirt and foreign objects.

Check for signs of seal damage (e.g. you may see a cut seal or small pieces of rubber coming from the piston area).

Check that the swivel of the hose unit rotates freely. For the first use, check for leakage and smooth coupling operation.

Each tank unit on the truck should also be briefly checked prior to use. Check for dirt, tightness and any obvious physical damage.

#### Connecting & disconnecting

a) Hose unit: When making the connection make sure that all relevant isolation valves connected to the hose unit are closed. Also check that no pumping pressure is present at the hose unit.

b) Tank unit: Make sure that all isolation valves behind the tank unit in the pipe work are fully open.

c) Lift the hose unit and hose into position to start the connection. Take care to support the hose end assembly so as to present the hose unit to the tank unit in the correct orientation. It is important to ensure that the hose unit is not supporting the full weight of the hose assembly during the connection process. Once connected, the hose unit will accommodate all reasonable strain of a balanced loading arm or hose assembly. The handles have no operating purpose other than providing handling assistance during the connection phase.

d) When correctly supported, the hose unit should slide easily over the tank unit. The three rollers engage in the three slots in any one of three positions at 120 degree centre. To allow the hose unit to locate to the tank unit, and still supporting the hose assembly, rotate the hose unit whilst gently pushing towards the tank unit.

e) Still supporting the hose assembly, rotate the hose unit clockwise about 100 degrees. At the start of rotation you will feel some resistance. The level of resistance is dependent upon the static line and tank pressure. The higher the pressure, the greater the effort necessary to connect the coupling.

At the completion of the 100 degree turn you will feel a definite stop. Do not attempt to rotate the unit further. Further rotation does not tighten the connection or open the valves more, it only cause unnecessary damage. Hose and tank unit valves are now open and the loading process can start.

f) The sequence of isolation valve andpump operation should be taken from your operating procedures. Preferably, the isolation valve on the tank unit side should be opened first, because trapped liquid in the tank unit could make it impossible to couple. The isolation valve on the hose unit side is usually opened after coupling.

g) Disconnect the coupling in reverse order. First, all isolation valves should be closed and - where possible - the pumps be switched off. Where a common pumping system is in use, all flow through the coupling shall be stopped using the isolation valves and not by the coupling. Closing the isolation valve on the hose unit side first is preferred because of the reasons stated in section (f), as long as this is compatible with your standard operating procedures.

h) Whilst supporting the hose unit assembly, turn the hose unit anti-clockwise approximately 100 degrees. You may feel a slight "pop off" effect at the end of the rotation travel when transferring liquids with an elevated vapour pressure. This is normal. Do not attempt to rotate the hose unit further. This will not further loosen the connection or secure the seal, it only causes unnecessary damage.

i) While supporting the hose assembly, pull the hose unit away from the tank unit. You may feel a small resistance due to seal vacuum. Correctly supported, the hose unit will come away from the tank unit with ease.

j) The hose assembly should be stowed in a manner so as to avoid physical damage. Do not drop the hose end assembly or stow on the floor. The dust plug provided should always be fitted.

k) Ensure the tank unit dust cap (if fitted) is coupled and secured.

I) Do not use anything other than the handles provided to operate the coupling. The handles are specifically designed to provide sufficient assistance in operation. Should the couplings become difficult to operate, they should be inspected prior to further use. Under no circumstances should the couplings be subjected to excessive force. The use of damaged or faulty equipment may have serious safety consequences.

#### Service Instructions for DDCouplings

### OUR RECOMMENADTIONS: Daily inspection:

- 1. Inspect the coupling surface for cleanliness and corrosion
- 2. Inspect the O-ring in the hose unit connection for serviceability and correct seating in the groove
- 3. Inspect the hose unit swivel for free rotation
- 4. Inspect tank and hose unit for faultlessness and external signs of leakage
- 5. Inspect the hose unit rollers for easy rotation and for external signs of seizure

## Instructions for Correct Installation and Maintenance of Mann Tek Couplings

All DACouplings, DDCouplings and DG-Couplings are designed for trouble free operation in a wide range of applications and operating conditions.

Reliable and safe operation is dependent upon the correct installation and handling of the equipment.

Regular and appropriate maintenance is essential to ensure both safety and reliability over the life of the equipment.

#### Specifications

Before you install Mann Tek couplings, it is essential to check that the material and performance specifications are acceptable for your specific application. The pressure ratings and primary materials of the construction are clearly indicated on the identification tag of each Mann Tek product. A drawing showing the materials of construction relating to each individual component is available upon request. If required, the technical department at Mann Tek will provide guidance on material suitability. Our data is taken from published chemical resistance information as well as our own application experiences.

Specification checks should always be carried out before the product is supplied, but if unsure, please ask. Especially if you are using the couplings outside the standard temperature range ( $-20^{\circ}$ C to  $+80^{\circ}$ C), ask for confirmation regarding your application.

Do not assume that a Mann Tek coupling supplied for one specific application automatically will be suitable for other similar applications.

Many variables affect the performance of materials. If you wish to use a DACoupling, DDCoupling or DGCoupling for a different application than the one originally specified, check with Mann Tek to ensure compatibility before installation. Please remember, the application details should include all media transferred through the coupling, not just the primary transferred media.

As with all equipment, a check should be made to ensure that the installation fulfils the requirements of applicable prevailing industry, local, national and international standards.

Particular attention should be paid to pressure ratings, safety factors and the position of upstream and downstream affiliated closures.

#### Installation

The correct installation of Mann Tek Couplings is essential to ensure safe and satisfactory operation. Checks should be made to ensure that their installation does not interfere with the correct operation of affiliated equipment (i.e. isolation valve, excess flow valves, etc).

## Instructions for Correct Installation and Maintenance of Mann Tek Couplings

Before securing the flange or thread connection to the mating equipment (i. e. hose, loading arm, storage tank) ensure that no dirt or foreign objects are present in the coupling. All flange and thread connections should be made without excessive strain to the equipment. Prior to use they should be pressure checked at least to 1.5 times of the maximum application working pressure. All gaskets and sealing materials used to make the permanent connection should be of suitable material and able to operate at least up to the maximum parameters of the Mann Tek coupling.

When installing DACouplings, DDCouplings and DGCouplings to new pipe work, tanks etc. ensure the system is free from debris that may be transferred through the coupling.

Where the hose or loading arm assembly is the primary static dissipation or earth route, the electrical continuity value of the assembly shall be checked to ensure regulatory compliance.

Special attention should be paid to the balancing of loading arms. The weight of the coupling plus transfer media should be taken into account at the specification stage. It is usual for loading arm balance settings to account of weight variations due to differences in the full/empty cycle. The loading arm should be set to balance in the condition present at the time or connection. For example, should the loading arm be empty at the time of connection then it should be balanced in the empty condition.

Each DACoupling, DDCoupling and DG-Coupling is designed to take reasonable loads associated with good handling practice but is not designed to accept continuous excessive loads associated with maladjustment or poor installation. Continuous excessive strain will lead to increased component wear and, if no actions will be taken, damaging the coupling and adjacent units up to failure of the connection. This means, under circumstances, high follow-up costs for environmental and personal injuries. When Mann Tek couplings are used with hoses, attention should be paid to hose length to ensure correct handling characteristics. The hose assembly should be designed such that the hose weight is supported by the coupling or the operator. Hoses should have a sufficient length to ensure operation well within the stipulated hose minimum bending radius. It is recommended to apply Safety Break-Away Couplings to protect the whole loading equipment against unintended external forces, e.g. caused by a drive-away accident. Further, measures against electrostatic loads are needed, especially at higher flow velocities (above approx. 5 m/s for fuels).

Prior to putting the system in use, a function check should be carried out. The hose unit (coupler) should connect and disconnect without physical interference or difficulty. Please note – the higher the static pressure, the greater the effort to make a connection. For more details please read the 'Operating Advice for Mann Tek Couplings'.

#### Maintenance

All DACouplings, DDCouplings and DG-Couplings should be visually checked for damage, etc. on a daily or shift basis according to the handling instructions. Any sign of damage or operating difficulty should be reported and acted upon at the earliest opportunity. Do not continue to use any equipment that is not operating satisfactorily as continued use will cause further deterioration and possible equipment failure.

Mann Tek couplings are designed such that all normal wear parts are included in appropriate maintenance kits. For normal applications, where the material is not, or only marginally attacked by the medium, the coupling will be fully usable after the regular maintenance.

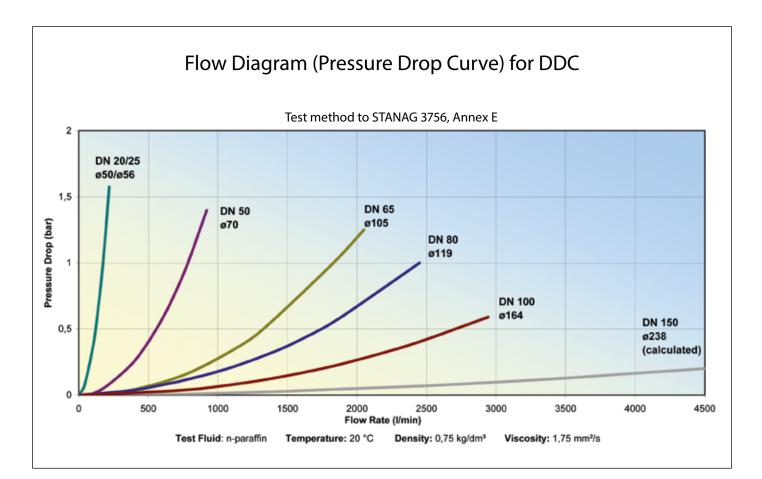

We recommend that the coupling is fully inspected, tested and serviced at least once a year. It must be accepted that some applications cause a greater level of component degradation either by chemical attack or by arduous physical or environmental conditions. In such circumstances a more frequent regime of inspection and service may be required. We recommend that in such applications a three monthly inspection should be carried out with automatic replacement of the hose unit piston and carrier seals. All other service parts and key components should also be checked. In addition to the three monthly inspection and primary seal replacement, the hose unit shall have the full repair kit applied every year independent from component condition. After a representative period of time it may be possible to increase the service / inspection interval, but only against a background of satisfactory operation.

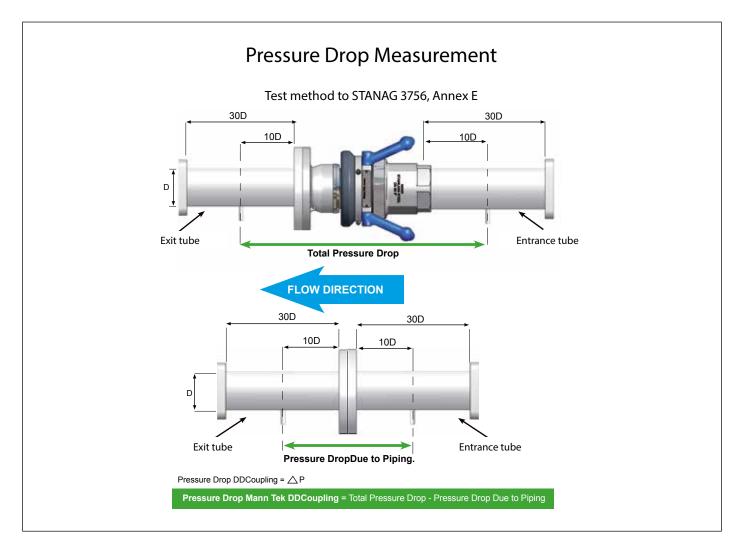

Full service instructions complete with photographs are available for each DA-Coupling, DDCoupling and DGCoupling size. These instructions show the service method as well as tools required and parts identification. DACouplings, DD-Couplings and DGCouplings are easy to maintain.

Some Mann Tek distributors are trained and accredited by Mann Tek to carry out service of Mann Tek couplings. Alternatively, Mann Tek offers a maintenance and repair service in their workshop. A service training can be offered as well, either on or off site to customers engineers who wish to carry out servicing themselves.

Mann Tek equipment should only be serviced by trained personnel.

The distributor of Mann Tek couplings has full responsibility to enclose this information to the customer. If the customer does not understand English the Distributor also have the responsibility to translate this document to a language the customer fully understand.

#### **Repair Service**

To comply with Health & Safety Regulations, all returned couplings and valves must be accompanied by a Certificate of Cleanliness and a data sheet for the last product carried (also for the cleaning medium).

#### Certificate of Decontamination

We certify that the returned couplings/valves have been cleaned prior to despatch and are free of any harmful substances.

Quantity:	Quantity: Code No.: Serial No.:				
Quantity:Code No.:Serial No.:	Quantity: Code No.: Serial No.:

When sending used couplings or valves to Mann Tek, please fill in this form and enclose it to the attach to the shipment.

#### About

Mann Tek is a Swedish manufacturer and supplier of Drv disconnect couplings with experience of the industry for more than 20 years. We supply modern, easy to use, safe and timesaving products. A environmentally safe system for both staff and its surroundings, which prevents a variety of hazards. Our products are the obvious choice in harsh and demanding environments and where there's a need of a safe and spill free handling of fluids, gases and bulk powders. With more than twenty years of knowledge and experience of multiply industries it has accumulated extensive expertise about applications in many types of variations in which our couplings have been, and can be used, with excellent results.

We constantly strive to develop and improve the performance and design of our products, to meet changes, new market demands and standards. Which, today, is what made us market leading.

Our couplings are the obvious choice when certifications and product approvals are required, anywhere in the world. Mann Tek® is certified to ISO9001:2008 and the products are produced in accordance with several important standards, e.g. the NATO STANAG 3756, NATO STANAG 3105, ISO 45, MS24484, British Aerospace Specification 2C14
